WARE PROTECTION SYSTEM

The ISM Ware Protection System (WPS) is designed to provide a replacement for pneumatically operated bottle covers.

These are requested by food jar fillers to meet strict hygiene requirements.

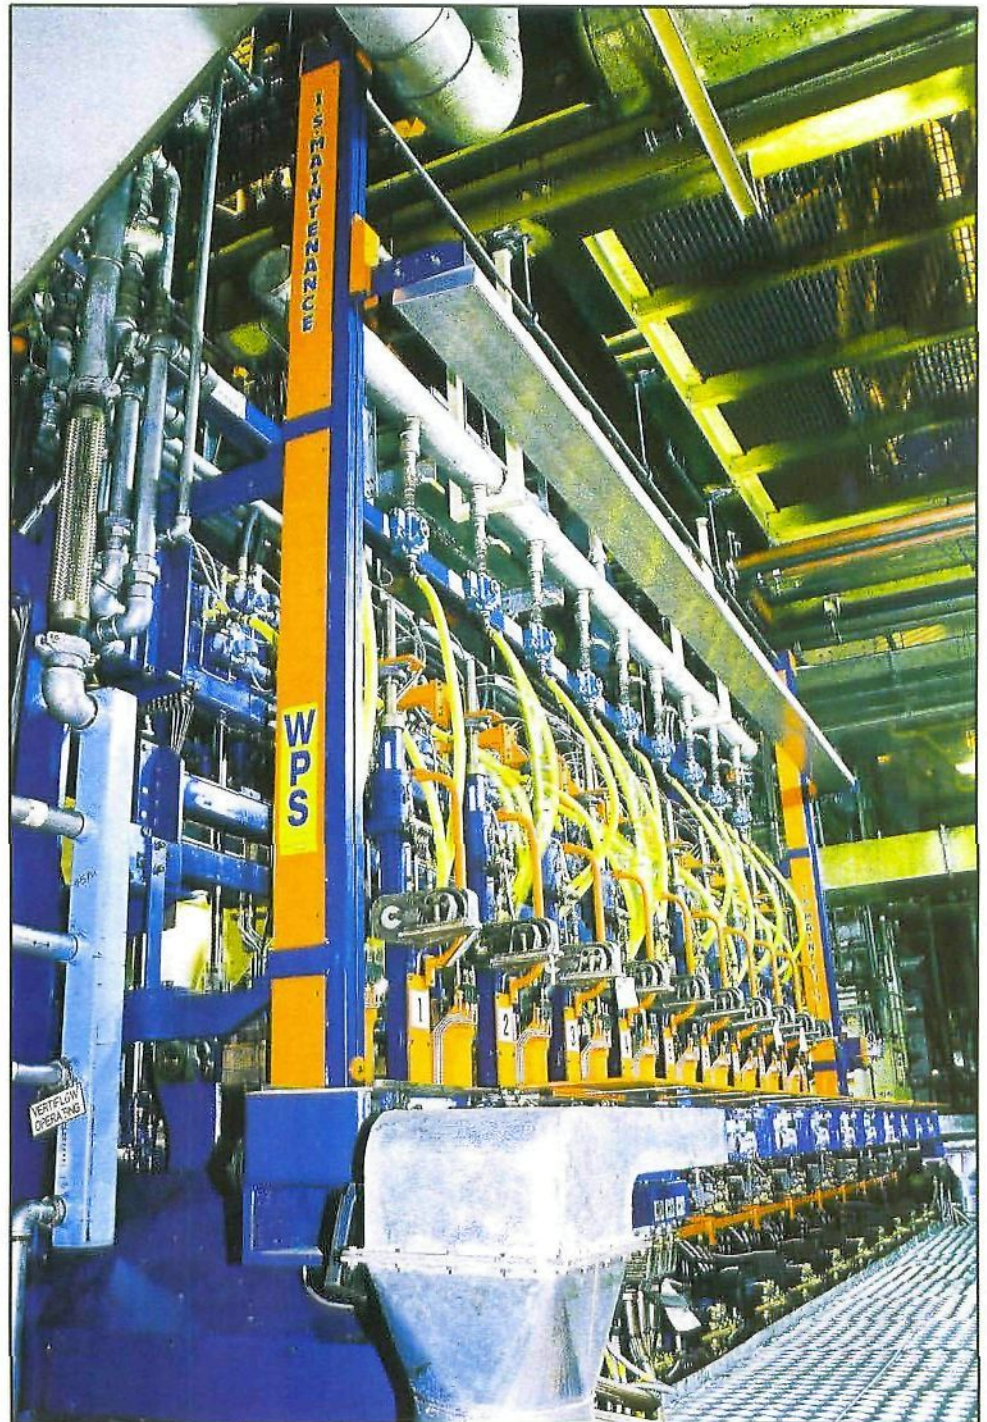

The cover is raised and lowered on a counterbalance system which, if required can be moved by hand. Combined with an electric motor the cover can be raised and lowered safely at the touch of a button.

The cover can be raised quickly during a jam up by pressing a single button. To lower the cover, the operator depresses the down button until the required position is reached.

The system also features two limit sensors to prevent overtravel. A manual clutch is fitted to the motor to enable the cover to be moved in the event of a power failure.

The WPS can be offered in two configurations:

- Manually operated
- Electrically operated

I.S. MAINTENANCE LTD

Excellence in Engineering for the Glass Container Industry

WARE PROTECTION SYSTEM - FEATURES

Lightweight steel and aluminum cover for total protection of the machine conveyor

Driveshaft links both uprights so that the cover is lifted evenly and smoothly

Guarded uprights cover the counterbalance weights and chains

Limit sensors prevent over travel of the cover. The lower sensor can be positioned to stop the cover at a required height above the conveyor.

Geared motor has an electrical powered brake and manual override clutch to enable the cover to be moved in the event of a power failure
